We offer high quality unique gear coupling that offers high torque transmission, capable of both high loads and high speed. The design of these coupling is such that it accommodates ample mechanical flexibility and compensation of parallel, angular and axial misalignment within allowable rating and permit axial end float. Unique gear couplings are mechanical device that transmit torque between two shafts. The couplings comprises of a flexible joint which is fixed to each shaft. The two joints of the couplings are connected by a third part called pin. The gear teeth in the coupling having high backlash allows angular misalignment. The excess backlash has the ability to contribute to the vibration.
